Let's Explore!

David and Will are talking about companies upgrading their systems.

Instructions: Read the text below.

David: Will, I have a question: how do companies know what and when they need to upgrade their systems?

Will: That's a striking question. Technologies will change fast whether we want it or not, so different tools may be needed to assess the software and hardware changes that a company needs to implement. They use real application testing to verify that the system changes will be positive.

David: How can they do that?

Will: If a company requires a change, they will use Database Replay. It allows recreating the workload environment on a test system. For example, by applying the patch; undesired results, new contention points, and even performance regression may be shown thanks to this test.

David: If I use that replay, I'll be able to see possible errors and when I make the changes, the risk of something being a failure will be low!

Will: Exactly. Database Replay may also be used to assess the upgrades, patches, or configuration changes to a system. In contrast, companies can also use SQL Performance Analyzer. This one is focused on testing the changes that can impact negatively the performance of a system.

David: They sound pretty similar to me!

Will: A little, I told you before when they use Database Replay, right? SQL Performance Analyzer is used when there are database upgrades, or configurations in the operating system, the hardware, or even the database initialization or schema changes.

David: I see. Database Replay focuses on new patches, upgrades, and storage. SQL Performance Analyzer is more focused on how the system will react to changes.

Will: Exactly, the use of both of them can keep a company system tuned so it runs the best it can.

Let's Practice!

David arranges priorities.

Instructions: Classify the sentences by writing the number of the sentence in the correct category. Check your exercise with your partner. Discuss.

1. If we need to assess software and hardware performance, we will need different specific tools.
2. I'll be able to see possible errors if I use the replay tool.
3. The database replay would run a test with the same workload if a system had a new patch.
4. If we needed to assess software and hardware performance, we would use different specific tools.
5. If a company requires a change, it will use Database Replay whether it was a little company or not.
6. If companies were aware of the constant changes in technology, they would test system upgrading at the correct time whether it were or not on their planning.

Sentences with the second conditional	Sentences with the first conditional

Let's Practice!

A Review on Important Vocabulary

Instructions: Read the clues. Find the words in the word search below. Compare your exercise with your partner. Discuss.

1. We use this adjective when we say something is impressive or surprising.
2. A verb that means to modify something, so it works adequately.
3. This is the amount of work that a person has to do during a defined time.
4. A verb that means to evaluate something or someone.
5. Something that we apply to already set programs to make changes on them

E	I	F	Y	Q	L	M	W	V	R	K	Y	O	K	P
G	D	X	M	N	G	N	I	K	I	R	T	S	H	Q
H	Z	M	W	H	O	G	E	O	P	G	U	V	I	H
D	T	L	O	T	D	I	X	L	C	V	A	Y	O	X
L	B	R	R	J	O	X	M	N	X	Q	O	Z	W	G
C	Q	F	K	C	O	O	K	S	G	H	F	Z	R	K
D	H	L	L	R	U	S	R	U	D	P	A	T	C	H
Z	A	F	O	G	J	R	C	I	C	S	R	U	P	P
Q	D	N	A	X	E	E	Y	Z	O	P	Y	N	W	H

Q	B	P	W	Z	N	S	S	E	S	S	A	P	Q	N

Extension Activity

Implementing Real Application Testing

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for further information on SQL Performance Analyzer and Database Replay.
- Imagine a case in which you have to change patches to a system in your company.
- Decide whether you use SQL performance Analyzer or Database Replay to measure the impact of those changes.
- Make a written report explaining your decision and the outcome that decision will carry.

Self-Assessment

Yes

No

- I look for information on real application testing.
- I forecast problems based on important decisions.
- I evaluate the outcome of applying certain changes to my company's software
- I write reports explaining and justifying important decisions in my company.

☐ ☐
☐ ☐
☐ ☐

Target Words

- striking** (adjective): impressive, surprising, amazing
e.g. That's a striking question.
Technologies will change fast whether we want it or not
- assess** (verb): to evaluate
e.g. Different tools may be needed to assess the software and hardware changes that a company needs to implement.
- in contrast** (adverb): different to the first one mentioned
e.g. Database replay may also be used to assess the upgrades, patches or configuration changes of a system. In contrast, companies can also use SQL performance analyzer
- workload** (noun): the amount of work to be done in a set time
e.g. It allows recreating the workload environment on a test system.
- patch** (noun): small codes that are installed into programs to fix mistakes or make changes
e.g. If a system had a new patch, the database replay would run a test with the same workload but applying the patch.
- tune** (verb): To adjust something so it works perfectly
e.g. Using them both can keep a company system tuned so it runs the best it can.

Learning Points

Passive of Modal Verbs: May

We use the **passive voice** when we want to emphasize on the action and not on the person who does it. **Passive voice** can be used anytime with **modal verbs**; we are going to focus on **may** this time.

Similar to might, **may** is used for possibility and permissions, but **may** is usually less formal and is not used in questions.

Structure

Subject + **may be** + verb in past participle + complement

Examples

*Any employer **may be called** for their annual review starting tomorrow.*

*Students **may be asked** to join different extra activity groups if their score is high.*

Examples

- *Different tools may be needed to assess the software and hardware changes that a company needs to implement.*
- *Undesired results, new contentions points and even performance regression may be showed thanks to this test.*
- *Database replay may also be used to assess the upgrades, patches or configuration changes of a system.*

Learning Points

Conditional Sentences: First vs Second Conditional with If and Whether

You can use conditionals with **if** or **whether**, but they have some differences.

Use **if** when making conditionals, let's review first and second conditionals.

The **first conditional** is used to talk about possible events or actions happening in the future depending on a condition.

Structure:

If + present tense sentence + future **will** sentence

Examples:

***If** a company **requires** a change, they **will** use Database Replay.*

***If** a company **doesn't** require a change, they **won't** use Database Replay.*

The **second conditional** is used to talk about hypothetical events in the future.

Structure:

If + past tense sentence + **would** sentence

Example:

If the company **required** a change, they **would** use Database Replay.

Whether is used as a conditional in formal contexts or when there is more than one possible result or even in the future. Another rule is that **whether** can't be used after prepositions.

Example:

Technologies will change our lifestyles **whether** we use them or not.

Examples

- *Technologies will change fast whether we want it or not.*
- *If a system had a new patch, the database replay would run a test with the same workload but applying the patch.*
