### Let's Start!

Let's talk about feature of business intelligence.

### Learning Outcome:

Exchange written and spoken information on principles, concepts, data base objects related to query analysis, and data base engines.  
Describe relational database, its concepts, and principles in spoken or written texts.

### Can Do Statements:

- I can understand written information about business intelligence.
- I can recall information to talk about business intelligence features.
- I can write a descriptive text to explain some business intelligence features.

### Ask your partner:

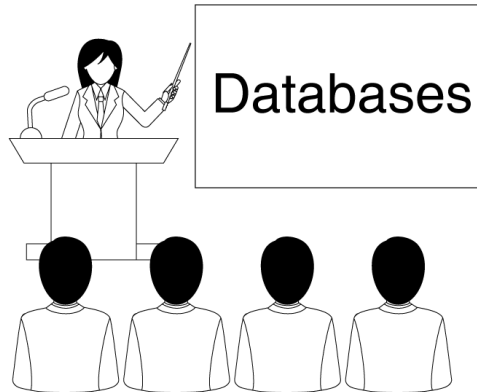

- Do big companies have the same database needs as small companies or individuals? Explain.
- What kind of database software or tools should be more focused on big companies?

## Let's Explore!

Listen to this professional talking about how databases offer a different service for big business.

*Instructions: Read the text below.*

Big companies and business are supposed to use specially designed tools to operate and handle enormous amounts of information. For that reason, Oracle Database has developed different features and tools that help companies with such big tasks. One of these tools is Data Warehousing: it is not meant to be used for transactions but it focuses on query and analysis, instead. Data warehousing stores historical data that has been retrieved from the transaction data. It helps consolidate data from different sources. This process receives the name of ETL; it extracts the information and then processes such data in order to load a result. Sometimes, the indexes are larger than the table data. For this reason, data warehousing can also use bitmap indexes, which are only a fraction of the original ones and help locate information easily.

Data warehousing was not supposed to be the only tool for business intelligence features. There are other features:

**Materialized View:** It improves query performance by allowing the access to table data; then it stores the results in a separate schema object that can be viewed and stored in any database,

**Table Compression:** Huge amounts of data won't be supposed to occupy all the disk space of a system. That's why Oracle has permitted data compression to ALL DATA, including backups and network traffics; this reduces the storage consumption.

**Parallel Execution:** One simple process is not supposed to handle all the work necessary for the system to run; multiple processes work simultaneously dividing this work and making it faster. It comes handy when working with large databases.

**Very Large Databases:** Big companies handle information that surpasses standards. In these cases, partitioning is pivotal. It generates partitions in the data, no modifications, just how it is organized permitting a consistent performance.

## Let's Practice!

### Data Management

*Instructions: Circle the correct answer. Read the questions aloud to your partner and compare your answers.*

1. What features is a business database warehouse supposed to have?
  - a. Lots of space, and tools to ease handling.
  - b. Open access.
  - c. A complex data management system.
2. What's a business tool for data management supposed to improve in a company?
  - a. Investment.
  - b. Customer service.
  - c. Data accessibility and control.
3. How's a business tool supposed to handle big data?
  - a. By incrementing the space requirements for saving the data.
  - b. By storing all the data, needed or not.
  - c. By implementing tools to save space, and improve capacity.
4. What's business intelligence supposed to mean?
  - a. The technology used in a big company.
  - b. The technology and strategies used at a company to improve processes.
  - c. The techniques used to store data.
5. Why are companies supposed to invest in data warehouses?
  - a. Because they need to store, and control their data to function.
  - b. Because it's a governmental demand.
  - c. Because they want to do it, and it's inexpensive.

## Let's Practice!

### Tools for Big Companies.

*Instructions: Circle the correct option to complete the sentence. Read the sentences aloud. Check your pronunciation with your instructor.*

1. We (have just used / just have used / have use) the subject oriented feature to analyze our data.
2. The company (has not never tried / has never try / has never tried) Oracle for data management.
3. The programmer (have restored / has restored / is restored) historical data, this is data taken from a timeline.
4. Agents (have searched / have search / haven't search) data from a table comprehension tool offered by oracle to speed up the finding process.
5. The system (has executed / have executed / has executing) two functions at the same time thanks to the parallel execution tool.

## Extension Activity

### Data Warehouse

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Look for information about how big companies handle data.
- Chose a company and write down its data management practices.
- Write a report about it characterizing those practices and the programs used to manage data.
- Share with your partners.

#### Self-Assessment

Yes

No

- I talk about data management in big companies.
- I write descriptive texts about data warehousing features.
- I describe business data handling utilities.
- I look for information about business data handling.

☐ ☐
☐ ☐
☐ ☐
☐ ☐

## Target Words

- enormous** (adjective): gigantic, very big  
e.g. They can operate and handle enormous amounts of information.
- meant to be** (phrasal verb): that is designed for an specific purpose  
e.g. One of these tools is Data Warehousing, it is not meant to be used for transactions, instead it focuses on query and analysis.
- simultaneously** (adverb): two or more actions that happen at the same time  
e.g. One simple process is not supposed to handle all the work necessary for the system to run; multiple processes work simultaneously, dividing this work and making it faster.
- permit** (verb): to allow, to give permission  
e.g. It generates partitions in the data, no modifications, just how it is organized, permitting a consistent performance.
- pivotal** (adjective): very important  
e.g. Big companies handle information that exceeds standards, in these cases, partitioning is pivotal.
- exceed** (verb): to go one step beyond in quality  
e.g. Big companies handle information that exceeds standards.

## Learning Points

### Be Supposed To Review

You can use **be supposed to** when talking about actions or events that you or someone expect to happen

#### Be supposed to in present tense

Use **be supposed to** in the **present tense** to talk about actions that are expected or that always happen in the same way.

Structure

Subject + am / is / are + supposed to + verb + complement

Example:

*Students **are supposed to** come to class until November 17th*

*Employees **are not supposed to** be late to any meeting*

#### Be supposed to in past tense

Use **be supposed to** to talk about actions that people expected in a certain condition in the past but are not longer true

Structure

Subject + was / were + supposed to + verb + complement

Examples

*I **was supposed to** send the email before Friday, but I couldn't.*

*Animals **were supposed to** be a good therapy for my son, but he is allergic to their fur.*

#### Be supposed to in present in future tense

Use it to talk about actions people will expect from you when certain conditions are met.

Structure

Subject + will be + supposed to + verb + complement

Examples

*As soon as you arrive to USA, you **will be supposed to** go directly to the office, we need you to sign some papers urgently.*

### Examples

- *Big companies or business are supposed to need special designed tools so they can operate and handle enormous amounts of information*
- *Data warehousing was not supposed to be the only tool for business intelligence features*
- *Huge amounts of data won't be supposed to occupy all the disk space of a system*
- *One simple process is not supposed to handle all the work necessary for the system to run*

## Learning Points

### Present Perfect Simple - Review

We use the **present perfect simple** when we talk about actions that started in the past but are still happening or are still important

Use **present perfect simple** in the following situations:

1. Situations that can happen again or have happened multiple times.
2. Actions that started in the past but are still happening or important.

Structure

Subject + have/has + verb in past participle + complement

Examples:

1. *I have visited Italy once (it could happen again in the future)*
2. *The city was flooded by the rain several times in the last century (it has happened many times during many decades)*
3. *They have studied Japanese since 2012 (and they still are)*
4. *Smartphones have become an essential part of life in the cities (and still are)*

### Examples

- *Oracle Database has developed different features and tools that help companies with such big tasks.*
- *It has historical data that has been retrieved from the transaction data.*
- *That's why Oracle has permitted data compression to ALL DATA, even backups and network traffics, this reduces the storage consumption*
