Let's Start!

Introducing Schemas and Common Schema Objects

Learning Outcome:

Exchange written and spoken information on principles, concepts, data base objects related to query analysis, and data base engines. Describe relational database, its concepts, and principles in spoken or written texts.

Can Do Statements:

- I can give a simple definition of schema and schema objects.
- I can list types of schemas and schema objects.
- I can talk about characteristics of types of schemas and schema objects.

Ask your partner:

- How do you think are schema and tables related? Explain.
- How do you think are indexes used in Oracle Database?

Let's Explore!

Mary is helping Joe to understand Schema and Schema Objects

Instructions: Read the text below.

Joe: Hi, Mary. Quick question: am I supposed to learn all about the schema and schema objects for tomorrow's class?

Mary: The teacher implied that they might be taken into account for the quiz on Friday. I'm going to review them now, want to join me?

Joe: Sure, thanks a lot.

Mary: Don't mention it. First, do you know what a schema and schema objects are?

Joe: On the one hand, a schema is just a collection of database objects. It has the name of the user, who is the owner at the same time. On the other hand, schema objects are logical structures that refer to database's data. These objects might be confused with the tablespaces, but they are not the same; schema objects can be in different tablespaces, and a tablespace can hold several schemas.

Mary: I thought you didn't know so much about this topic!

Joe: That's all I know, I have to study the different types of schema objects: tables, indexes, views, clusters, and synonyms.

Mary: Those are easy! There are five types in total. Tables are simply a basic unit of data storage, they have all the user accessible data, and they are divided into columns and rows.

Joe: Wait a minute! Aren't indexes supposed to be tables?

Mary: No, they aren't. Indexes are optional; they are just structures that might be associated with tables, so information retrieval becomes easier. The views are supposed to be a kind of table; they are data presentations, and they hide data complexity and store complex queries.

Joe: What about clusters and synonyms?

Mary: Clusters are a group of tables that are physically stored on the same disk. It helps to improve the disk access time. Finally, the synonyms are just alias or nicknames that you can give to different types of files; they don't require storage space, since they have their definition in the data dictionary.

Let's Practice!

Don't confuse schemas with tablespaces!

Instructions: Read the paragraph. Underline all the mistakes in the paragraph.

Schema and schema objects might being taken into account for the quiz on Friday; let's review them now: It might be knowing that schema is just a collection of database objects; These objects might be confuses with the tablespaces, but they are not the same.

Let's Practice!

Classify them is easy!

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. They are supposed to be a kind of table.
2. They are supposed to be data presentations.
3. They are supposed to hide data complexity.
4. They are supposed to be a group of tables.
5. They are physically stored in the same disk.
6. It is supposed to help to improve the disk access time.
7. They are supposed to be alias or nicknames that you can give to different type of files.
8. They aren't supposed to require storage space.

Views	Clusters	Synonyms

Extension Activity

Design the exam!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Imagine you are the teacher and design an exam about Schema Objects.
- Ask some of your classmates to answer the exam.
- Discuss the answers with your partners.

Self-Assessment

Yes

No

- I create questions about Schema Objects.
- I clarify information.
- I exchange information with partners.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **Imply** (verb): to indicate or suggest something
e.g. The teacher implied that they might be taken into account for the quiz on Friday.
- **Simply** (adverb): in a simple way
e.g. Tables are the first ones, it is simply a basic unit of data storage, they have all the user accessible data, it is divided into columns and rows.
- **Owner** (noun): the person who is proprietor of something
e.g. A schema is just a collection of database objects; it has the name of the user, who is the owner at the same time.
- **Several** (adverb): similar to "many"
e.g. Schema objects can be in different tablespaces, and a tablespace can hold several schemas.
- **Topic** (noun): a subject or theme
e.g. I thought you didn't know so much about this topic.
- **Retrieval** (noun): the recovery or rescue of information
e.g. Indexes are optional; they are just structures that might be associated with tables, so information retrieval becomes easier.

Learning Points

Be Supposed to in Questions

We use **be supposed to** when we are talking about actions that we expect from people.

We use **be supposed to** when we are talking about actions that we expect from people.

We use the especial word combination "be supposed to" to talk about actions or events that everyone is expecting to happen.

In questions, we use it to confirm information. To use it, we follow this structure:
Be + subject + supposed to + verb + complement + ?

Examples

***Are you supposed to** clean all this room alone? That's too much work.*

***Is she supposed to** be here early? I heard she was late.*

Examples

- *Am I supposed to learn all about the schema and schema objects for tomorrow class?*
- *Wait, aren't indexes supposed to be tables?*

Passive of Modal Verbs: Might

We use the **passive voice** when we want to emphasize in the action and not in the person who does it.

Passive voice can be used anytime whenever we want focus on the action. This time, we are going to explain how "might" is used with passive voice.

We use **might** to show possibility or to ask for permission.

In **passive voice**, it is the same, but the person behind the action is not important.

Structure

Subject + might be + verb in past participle + complement

Examples

*Alcoholism **might be considered** one of America's biggest problems.*

*I **might be accepted** for that new position at the office.*

Examples

- *The teacher implied that they might be taken into account for the quiz on Friday*
- *These objects might be confused with the tablespaces, but they are not the same*
- *they are just structures that might be associated to tables, so information retrieval becomes easier*
