Let's Start!

Let's access the database!

Learning Outcome:

Exchange written and spoken information on principles, concepts, data base objects related to query analysis, and data base engines. Describe relational database, its concepts, and principles in spoken or written texts.

Can Do Statements:

- I can understand written information about accessing an Oracle database.
- I can recall information about the components to access an Oracle database.
- I can write a summary of a text about accessing a database.

Ask your partner:

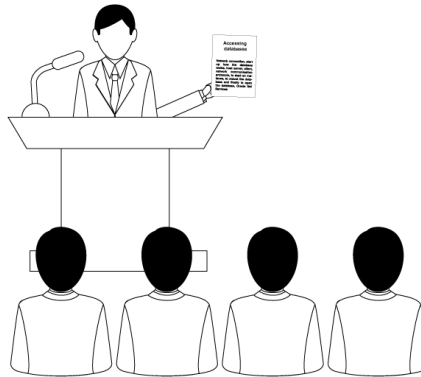

- What do you think is the best way to create an access to a database?
- Do you need to create the same access every time you enter to the same database? Explain.

Let's Explore!

Listen to the expert describing how to access a Database.

Instructions: Read the text below.

Accessing a database and doing network connection are easier than it sounds; you just need to understand how the database works and how to start it up.

If you want to start the database up, you need to use Oracle Net Services. They are an interface between the database and the network communication protocols. These protocols are in charge of defining how data are transmitted and received. When an application developer creates apps, minor changes should be taken from the database, so it can use the Net services.

Oracle net is a component that must be installed on both computers, user's and server's, so it can establish the network session. It acts as a courier sending messages from one to the other.

You will need to follow 3 steps if you want to start the session up: first, to start an instance, second, to mount the database, and third, to open the database. Let's have a better look at how this works through an example.

A computer starts the instance with the oracle database; this is the host server. The other computer has an application that runs a user process, this way the client is attempting to connect to the host server.

If the proper Oracle Net Services driver is running, the host server detects the connection and starts a process on behalf of the user. Then, the client should be asked to provide a username or password. This information is recorded in the redo log file. If it is successful, a message is sent, but if the transaction were not successful, the host server would display an error message.

Take into account that other background processes are running; some of them are used to prevent contention, so transactions that use the same data are not required. It is like entering a password multiple times.

Let's Practice!

It shouldn't be a problem to access a database.

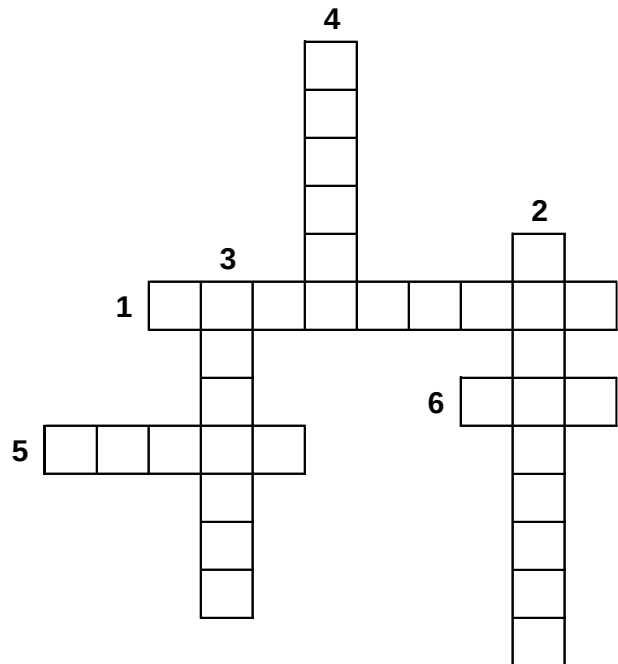

Instructions: Read the clues. Complete the crossword.

Down

- _____ a database shouldn't be taken as a problem since the process is really easy to carry on.
- It should be known that an _____ is needed to initiate the process of accessing a database.

Across

- The Oracle Net Services plays the role of a _____ as it should be installed in both, the user's and server's computers to make the connection.
- _____ Net Services are considered the constituent that should be seen as a bridge between the database and the network communication protocols.
- The network communication protocols should be taken into account as important components in the process to _____ the database up, since they are in charge of the transmission of data and information.
- The Oracle _____ Services also establishes the network session.

Let's Practice!

If you wanted, I would help you right away!

Instructions: Organize the mystery sentences. Write the sentences the gap provided.

- up / I / wouldn't / to / know / help. / If / a / wanted / session, / my / starting / deny / about / you
- not / to / component / didn't / database / if / a / Net / initiate / be / It / possible / would / the / Oracle / exist.
- session / if / weren't / the / steps / three / not / properly / start / up / applied. / would / The

Extension Activity

I can know more about accessing a database.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about accessing a database.
- List the steps to start up a database.
- Create a post with the steps to start up a database.
- Share with your partners the post you created.

Self-Assessment

Yes

No

- I look for more information about accessing a database.
- I list the steps to start up a database.
- I create a post with the steps to start up a database.
- I share with your partners the post I created.

☐	☐
☐	☐

Target Words

- **start up** (phrasal verb): To initialize
e.g. If you want to start up the database, you need to use Oracle Net Services
- **on behalf** (expression): to be a representative of something or someone.
e.g. If the proper Oracle Net Services driver is running, the host server detects the connection and starts a process on behalf of the user.
- **in charge of** (expression): responsible for
e.g. These protocols are in charge of defining how data is transmitted and received.
- **minor** (adjective): small and in few amounts
e.g. minor changes should be needed from the database so it can use the Net services.
- **courier** (noun): A messenger that gives and sends messages or email.
e.g. it acts as a courier sending messages from one to the other.
- **mount** (verb): To stablish or make the stand for something to be put on.
e.g. You will need 3 steps if you want to start up a database: 1) to start an instance, 2) to mount the database, 3) to open the database.

Learning Points

The Passive of Modal Verbs: Should

You use the **Passive Voice** when you want to emphasize in the action and not in the person who does it. Passive voice can be used anytime; you are going to focus on **Should** this time.

Use **should** when you make some recommendation. Remember that we are focusing on the action, and not on the person. See the following chart to see the structure:

Subject	should be	verb in past participle	complement
<i>The project</i>	<i>should be</i>	<i>finished</i>	<i>before November, or we'll have to work the holidays.</i>
<i>Any suggestion</i>	<i>should be</i>	<i>sent</i>	<i>via email because the boss never checks the suggestion box at the office.</i>

Examples

- *When an application developer creates apps, minor changes should be needed from the database so it can use the Net services.*
- *Then, the client should be asked to provide a username or password*

How to Summarize a Text

A **summary** is a cognitive process related to the ability to identify explicit and implicit ideas of a text. To create a summary is necessary to be able to categorize such ideas in a hierarchical order: main idea, secondary ideas, etc., and retell or paraphrase them consequently.

Summarizing a text is simple. These are tips that you can use when reading any kind of text:

1. Read the whole text once to understand the overall meaning.
2. You should try to read between lines in case there is hidden information.
3. Look for the meaning of unusual words on a dictionary.
4. Make a list of the most important points or arguments of the text. You can underline the text or use a highlighter.
5. Organize those key elements in chronological order if it is a story, or in order of importance in other cases.
6. Proofread your summary to see if it is clear.
